CAN LIFESTYLE CHANGE HELP EARLY ALZHEIMER'S?

IN A SMALL 2024 TRIAL, THINKING IMPROVED.

20 wks of intensive lifestyle change improved thinking and daily function in people with early Alzheimer's, while the control group got worse on all 4 measures (randomized, 51 people).

Ornish et al. · Alzheimer's Research & Therapy · 2024 [1]

WHAT DID THEY CHANGE?

- **Whole-food, plant-based diet**
- **Exercise**
- **Stress management**
- **Group support**

A comprehensive program, not diet alone.

WHAT SHOULD YOU ASK YOUR DOCTOR?

1. **What can I do now to lower my risk of memory decline?** [2]

2. **Could changing my diet and exercise help my memory?** [1]

3 **Are my blood pressure, blood sugar and cholesterol controlled well enough to protect my brain?**

4 **How will we measure changes in my memory?**

1,260 older adults in the FINGER trial: diet, exercise, brain training and heart-risk checks improved thinking scores slightly more than health advice.

Ngandu et al. · The Lancet · 2015 [2]

! **Work with your doctor, not around them. Never stop a medication on your own.**

BOTTOM LINE **Promising, not proven. One small trial says yes; bigger diet-only trials are mixed.**

MORE OF THE EVIDENCE

- In a 20-week randomized trial of 51 people with mild cognitive impairment or early Alzheimer's, an intensive program (whole-food, plant-based diet, exercise, stress management and group support) improved several measures of thinking and daily function. The control group got worse. [1]
- In the FINGER trial of 1,260 older adults at risk, a 2-year program of diet, exercise, brain training and heart-risk checks improved thinking scores slightly more than general health advice. [2]
- In the MIND trial of 604 older adults without memory problems, the MIND diet did no better than a control diet over 3 years. [3]

Keep in mind: The promising trial was small and short. Neither large trial used a fully plant-based diet.

WE TAKE ZERO PRESCRIPTIONS.

That's our choice, not a rule for you. Some prescriptions save lives, like antibiotics for an infection. If you are not changing your diet, stay on the medications your doctor prescribes. If you go plant-based, keep up with your blood work. That way your doctor can safely reduce your medications or take you off them altogether.

I'm not anti-medicine. I'm pro-health.

Don't take my word for any of this. Check it with your favorite AI, read the original studies, then bring them to your doctor.
